Matlab Codes for Seismic: An In-Depth Guide

Matlab codes for seismic are invaluable tools for geophysicists, seismologists, and engineers working in the field of earthquake analysis, seismic data processing, and structural health monitoring. MATLAB, with its powerful computational capabilities and extensive library of toolboxes, provides an ideal environment for developing custom scripts and algorithms to analyze seismic signals, simulate wave propagation, and interpret subsurface structures. This article explores various aspects of MATLAB programming tailored to seismic data, from basic signal processing to advanced modeling techniques, offering readers practical insights and example codes to enhance their research and engineering projects.

Fundamentals of Seismic Data Processing in MATLAB

Understanding Seismic Data

Seismic data consist of time-series signals recorded by seismographs or accelerometers. These signals typically contain information about ground motion caused by earthquakes, explosions, or ambient vibrations. Key features include amplitude, frequency, phase, and arrival times of seismic waves such as P-waves and S-waves.

Common Seismic Data Formats

Seismic data are stored in various formats, including SAC (Seismic Analysis Code), SEGY, and miniSEED. MATLAB supports reading and writing these formats through specialized toolboxes or custom scripts:

- Reading SAC files using built-in functions or third-party toolboxes
- Importing SEGY data for three-component seismic traces
- Handling miniSEED data for continuous recordings

Basic MATLAB Codes for Importing and Visualizing Seismic Data

Below is an example code snippet to load a SAC file and plot the seismic trace:

```
```matlab
```

```
% Load SAC file

sacData = readsac('example.sac');

% Extract time and amplitude

time = sacData.datenum + (0:length(sacData.data)-1)/sacData.delta;

amplitude = sacData.data;

% Plot seismic trace

figure;

plot(time, amplitude);

xlabel('Time (s)');

ylabel('Amplitude');

title('Seismic Trace');

grid on;

'''
```

This simple code reads a SAC file, extracts the data, and visualizes the seismic waveforms, serving as a foundation for further analysis.

## Signal Processing Techniques for Seismic Data in MATLAB

### Filtering and Noise Reduction

Seismic signals often contain noise from environmental or instrumental sources. Effective filtering improves signal clarity.

- **Bandpass filtering:** Isolates specific frequency bands relevant to seismic waves.
- **Notch filtering:** Removes narrowband interference, such as powerline noise.
- **Wavelet denoising:** Preserves transient features while reducing noise.

Example: Applying a bandpass filter to seismic data.

```
```matlab

% Define filter parameters

fs = 100; % sampling frequency in Hz

lowCut = 0.5; % lower cutoff frequency

highCut = 20; % upper cutoff frequency

% Design Butterworth filter

[b, a] = butter(4, [lowCut, highCut]/(fs/2), 'bandpass');

% Apply filter

filteredData = filtfilt(b, a, amplitude);

% Plot original and filtered signals

figure;

subplot(2,1,1);

plot(time, amplitude);

title('Original Seismic Signal');

xlabel('Time (s)');

ylabel('Amplitude');

subplot(2,1,2);

plot(time, filteredData);

title('Filtered Seismic Signal');

xlabel('Time (s));
```

```
ylabel('Amplitude');
```

```
...
```

Spectral Analysis

Spectral analysis helps identify dominant frequencies and seismic wave characteristics.

- Fast Fourier Transform (FFT)
- Power Spectral Density (PSD)
- Spectrograms for time-frequency analysis

Example: Computing and plotting the PSD.

```
```matlab
```

```
% Compute PSD
```

```
window = hamming(1024);
```

```
nfft = 2048;
```

```
[pxx, f] = pwelch(filteredData, window, [], nfft, fs);
```

```
% Plot PSD

# Seismic Wave Propagation Modeling in MATLAB

## Simulating Seismic Wave Travel

Understanding how seismic waves propagate through the Earth's subsurface is critical for interpretation and hazard assessment.

## Finite Difference Method for 1D Wave Equation

A common approach involves discretizing the wave equation in space and time.

Example code snippet:

```
```matlab

% Parameters

c = 3000; % wave speed in m/s

dx = 10; % spatial step in meters

dt = dx / (2 * c); % time step

L = 1000; % length of the model in meters

nx = L/dx; % number of spatial points

nt = 500; % number of time steps

% Initialize displacement arrays

u = zeros(nx,1);

u_prev = zeros(nx,1);

u_next = zeros(nx,1);

% Source

source_pos = round(nx/4);
```

```
amplitude = 1;

% Time stepping

for t = 1:nt

    for i = 2:nx-1

        u_next(i) = 2u(i) - u_prev(i) + (cdt/dx)^2 (u(i+1) - 2u(i) + u(i-1));

    end

    % Inject source

    u_next(source_pos) = u_next(source_pos) + amplitude exp(-((t - 20)^2)/100);

    % Boundary conditions (absorbing)

    u_next(1) = 0;

    u_next(end) = 0;

    % Update previous states

    u_prev = u;

    u = u_next;

    % Plot at intervals

    if mod(t, 50) == 0

        plot(0:dx:L-dx, u);

        title(['Seismic Wave at time step ', num2str(t)]);

        xlabel('Distance (m)');

        ylabel('Displacement');

        ylim([-1,1]);
```

```
drawnow;
```

```
end
```

```
end
```

```
```
```

This simulation visualizes seismic wave propagation in a 1D medium, a fundamental step toward more complex 2D or 3D models.

## Modeling Seismic Attenuation

Attenuation models incorporate energy loss as seismic waves travel, affecting amplitude and frequency content.

A typical model applies exponential decay:

```
```matlab
```

```
% Attenuation parameters
```

```
distance = 1000; % in meters
```

```
Q = 100; % quality factor
```

```
f = 10; % dominant frequency in Hz
```

```
% Attenuation factor
```

```
alpha = (pi * f) / (Q * 343); % wave velocity assumed as 343 m/s for air
```

```
% Apply attenuation
```

```
attenuated_signal = filteredData . exp(-alpha * distance);
```

```
```
```

This code demonstrates how amplitude diminishes with distance, incorporating physical parameters.

## Advanced Seismic Data Analysis in MATLAB

## Automatic Event Detection

Detecting seismic events involves identifying characteristic signals amid noise. Algorithms include STA/LTA (Short-Term Average / Long-Term Average), which triggers on sudden amplitude increases.

Example implementation:

```
```matlab

% Calculate STA/LTA

window_short = 1 fs; % 1 second window

window_long = 10 fs; % 10 seconds window

sta = movmean(abs(filteredData), window_short);

lta = movmean(abs(filteredData), window_long);

ratio = sta ./ lta;

% Thresholding

threshold = 3;

events = ratio > threshold;

% Plot

figure;

plot(time, ratio);

hold on;

plot(time, thresholdones(size(time)), 'r--');

title('STA/LTA Ratio for Event Detection');

xlabel('Time (s)');
```

```
ylabel('Ratio');  
  
legend('STA/LTA', 'Threshold');  
  
grid on;  
  
...
```

svmModel = fitcsvm(X, Y, 'KernelFunction', 'rbf');

% Predict

predictedLabels = predict(svmModel, X_test);

...`
```

## Seismic Data Visualization and Interpretation in MATLAB

title('Seismic Seismogram');

xlabel('Time (s)');

ylabel('Amplitude');

% Spectrogram
