Common Types of Questions in Economics Activity 3

Economics activity 3 often includes a variety of mathematical problems designed to test understanding of key concepts. These may include:

1. Calculating Elasticity

Understanding price elasticity of demand or supply involves computing percentage changes and interpreting the results.

2. Profit and Cost Analysis

Questions may ask for the calculation of profit, total cost, average cost, or marginal cost.

3. Revenue and Profit Maximization

Activities often require finding the quantity at which profit is maximized, involving derivatives or algebraic solutions.

4. Market Equilibrium

Determining equilibrium price and quantity by setting demand equal to supply.

5. Budget Constraints and Optimization

Maximizing utility or profit subject to budget constraints involves solving systems of equations.

Step-by-Step Approach to Solving Math Practice for Economics Activity 3

To effectively tackle activity 3 questions, students should follow a structured approach:

Step 1: Carefully Read and Understand the Question

Identify what is being asked. Highlight key variables, data points, or formulas provided.

Step 2: Write Down Known Values and Unknowns

Create a clear list of given data and what needs to be calculated.

Step 3: Recall Relevant Formulas or Concepts

Determine which economic principles or mathematical formulas apply, such as elasticity formulas, profit functions, or equilibrium conditions.

Step 4: Set Up the Mathematical Model

Translate the problem into algebraic or calculus equations, defining variables as needed.

Step 5: Solve the Equations Step-by-Step

Use algebra, derivatives, or other mathematical tools to find the unknowns.

Step 6: Interpret the Results

Ensure the answers make economic sense. For example, elasticity should be a positive number, and profit should be maximized at a specific output level.

Step 7: Verify Your Solution

Check calculations for errors and confirm that the solution satisfies the original problem.

Sample Questions and Solutions

To illustrate the process, here are typical questions from economics activity 3, along with detailed solutions.

Question 1: Calculating Price Elasticity of Demand

Given: When the price of a product decreases from \$10 to \$8, the quantity demanded increases from 100 units to 150 units. Calculate the price elasticity of demand.

Solution:

- Calculate the percentage change in quantity demanded:

\[

$$\% \Delta Q = \frac{150 - 100}{100} \times 100 = 50\%$$

\]

- Calculate the percentage change in price:

\[

$$\% \Delta P = \frac{8 - 10}{10} \times 100 = -20\%$$

\]

- Elasticity formula:

$$E_d = \frac{\Delta Q}{\Delta P} = \frac{50}{-20} = -2.5$$

- Interpretation:

The demand elasticity is 2.5 (absolute value). Since it's greater than 1, demand is elastic, meaning consumers are sensitive to price changes.

Question 2: Finding the Profit-Maximizing Output

Given: The total revenue (TR) function is $(TR = 50Q)$, and the total cost (TC) function is $(TC = 20Q + 100)$. Find the output level (Q) that maximizes profit.

Solution:

- Write profit function:

$$\pi = TR - TC = 50Q - (20Q + 100) = 30Q - 100$$

- Since the profit function is linear and increasing with (Q) , profit maximizes at the highest feasible production level. However, in realistic scenarios, constraints or diminishing returns apply.

- If no constraints are specified, profit increases with (Q) . To find maximum profit with constraints, additional info is needed.

- For illustration, suppose production is limited to a maximum of 20 units:

\[

$$Q_{\max} = 20$$

\]

- Calculate profit at $(Q=20)$:

\[

$$\pi = 30 \times 20 - 100 = 600 - 100 = 500$$

\]

- Conclusion:

The firm maximizes profit at the highest feasible output within constraints, which is 20 units, yielding a profit of \$500.
