Numerical of Physics Class 11 Chap 3 is an essential component of the physics curriculum, helping students grasp complex concepts through practical problem-solving. Chapter 3 primarily deals with Motion in a Straight Line, and mastering the numerical problems in this chapter is vital for scoring well in exams. These numerical exercises enhance understanding of key concepts such as displacement, velocity, acceleration, and their interrelations. In this article, we will explore various types of numerical problems from Chapter 3, provide step-by-step solutions, and offer tips to approach these questions effectively.

Understanding the Importance of Numerical Problems in Physics Class 11 Chapter 3

Numerical problems serve as a bridge between theoretical concepts and real-world applications. They test a student's ability to apply formulas, interpret data, and develop problem-solving skills. For Chapter 3, which focuses on motion in a straight line, numerical exercises help reinforce concepts such as:

- Displacement, velocity, and acceleration
- Graphical interpretation of motion
- Equations of motion in various scenarios

Practicing these problems regularly prepares students for both school exams and competitive exams like JEE and NEET.

Types of Numerical Problems in Chapter 3

Numerical exercises in Chapter 3 can be broadly categorized based on the concepts involved:

1. Problems on Uniform Motion

These involve objects moving with constant velocity. Typical questions include calculating distance traveled or time taken given velocity and vice versa.

2. Problems on Uniformly Accelerated Motion

These problems involve objects accelerating uniformly, requiring the application of equations of motion such as:

- $v = u + at$
- $s = ut + \frac{1}{2}at^2$
- $v^2 = u^2 + 2as$

3. Graphical Interpretation of Motion

Questions here involve interpreting velocity-time or displacement-time graphs, calculating slopes, areas, and understanding motion patterns.

4. Relative Velocity Problems

These questions deal with the velocity of one object relative to another, especially when they are moving in opposite or same directions.

5. Problems Involving Free Fall and Projectile Motion

While projectile motion extends beyond Chapter 3, basic free fall problems are often included, involving acceleration due to gravity.

Sample Numerical Problems with Step-by-Step Solutions

Let's explore some representative problems from each category to understand their solutions better.

Problem 1: Uniform Motion

Question: A car travels at a constant speed of 60 km/h. How much time does it take to cover a distance of 150 km?

Solution:

Step 1: Convert units (if necessary). Here, speed is in km/h, and distance in km, so units are consistent.

Step 2: Use the formula:

$$t = s / v$$

where $s = 150$ km, $v = 60$ km/h

Step 3: Calculate:

$$t = 150 / 60 = 2.5 \text{ hours}$$

Answer: The car takes 2.5 hours to cover 150 km.

Problem 2: Uniformly Accelerated Motion

Question: An object starts from rest and accelerates uniformly at 5 m/s^2 . Find the velocity after 10 seconds and the distance traveled in that time.

Solution:

Step 1: Identify knowns:

$$u = 0 \text{ m/s (starts from rest)}$$

$$a = 5 \text{ m/s}^2$$

$$t = 10 \text{ s}$$

Step 2: Calculate final velocity (v):

$$v = u + at = 0 + (5)(10) = 50 \text{ m/s}$$

Step 3: Calculate displacement (s):

$$s = ut + \frac{1}{2}at^2 = 0 + \frac{1}{2}(5)(10)^2 = 0 + 0.5 \cdot 5 \cdot 100 = 250 \text{ m}$$

Answer: Final velocity is 50 m/s; distance traveled is 250 meters.

Problem 3: Graphical Interpretation

Question: A velocity-time graph shows a straight line decreasing from 20 m/s to 0 m/s over 4 seconds. Find the acceleration and the total displacement during this period.

Solution:

Step 1: Calculate acceleration (a):

$$a = (v_{\text{final}} - v_{\text{initial}}) / t = (0 - 20) / 4 = -5 \text{ m/s}^2$$

(The negative sign indicates deceleration.)

Step 2: Calculate displacement (area under the graph):

Since the graph is a triangle,

$$s = \frac{1}{2} \text{ base height} = \frac{1}{2} \times 4 \times 20 = 40 \text{ m}$$

Answer: Acceleration is -5 m/s^2 ; displacement during 4 seconds is 40 meters.

Problem 4: Relative Velocity

Question: Two cars start from the same point. Car A moves at 80 km/h east, and Car B at 60 km/h east. What is the velocity of Car B relative to Car A?

Solution:

Step 1: Relative velocity:

$$V_{b/a} = V_b - V_a = 60 \text{ km/h} - 80 \text{ km/h} = -20 \text{ km/h}$$

Step 2: Interpretation:

The negative sign indicates Car B is moving 20 km/h west relative to Car A, which makes sense because Car A is faster moving east; relative to Car A, Car B appears to move west at 20 km/h .

Answer: The velocity of Car B relative to Car A is 20 km/h west.

Problem 5: Free Fall

Question: An object is dropped from a height of 80 meters. Calculate the time it takes to reach the ground. Assume acceleration due to gravity, $g = 9.8 \text{ m/s}^2$.

Solution:

Step 1: Use the equation:

$$s = \frac{1}{2}gt^2$$

Rearranged to solve for t:

$$t = \sqrt{(2s / g)}$$

Step 2: Substitute values:

$$t = \sqrt{(2 \cdot 80 / 9.8)} = \sqrt{(160 / 9.8)} = \sqrt{16.33} = 4.04 \text{ seconds}$$

Answer: It takes approximately 4.04 seconds to reach the ground.
