The circuit operates by monitoring the battery voltage and controlling the relay to connect or disconnect the charger accordingly.

Operation Modes

The circuit generally works in two primary modes:

- Charging Mode
 - When the battery voltage drops below a set threshold, the NE555 timer outputs a high signal.
 - This energizes the relay coil, closing the contacts.
 - The charging source supplies current to the battery.
- Maintenance/Float Mode

- When the battery reaches the desired full charge voltage, the sensing circuitry triggers the NE555 output to go low.
- The relay de-energizes, disconnecting the charging source.
- The system maintains the battery at a safe, float charge level, preventing overcharging.

Step-by-Step Explanation of Circuit Operation

- Voltage Sensing
 - A voltage divider reduces the battery voltage to a safe level for comparison.
 - A reference voltage (possibly from a Zener diode or a voltage regulator) is used to set the threshold.
- Triggering the NE555 Timer
 - When the sensed voltage is below the threshold, the NE555 is configured to output a high signal.
 - This output energizes the relay coil via a transistor or driver circuit.
- Relay Activation
 - The relay closes its contacts, enabling the charging current flow to the battery.
 - During charging, the system actively monitors the voltage.
- Automatic Disconnection
 - Once the battery reaches the full charge voltage, the sensing circuit disables the NE555 output.

- The relay de-energizes, disconnecting the charger.
