A systematic approach to model joint and link parameters:

- Link length (a): Distance between joint axes
- Link twist (?): Angle between axes
- Link offset (d): Distance along the previous z-axis
- Joint angle (?): Rotation about the z-axis

Using D-H parameters, the forward kinematics can be derived to compute the position and orientation of the end-effector.

$\mathcal{L}$

$$L = T - V$$

\]

where (L) is the Lagrangian, (T) is kinetic energy, and (V) is potential energy.

The equations of motion derived from the Lagrangian are expressed as:

\[

$$\frac{d}{dt}\left(\frac{\partial L}{\partial \dot{q}_i}\right) - \frac{\partial L}{\partial q_i} = \tau_i$$

\]

where (q_i) are joint variables, $(\dot{q}_i)$ are their derivatives, and (τ_i) are joint torques.
