Fuel Filter(s)

Fuel filters are critical for removing impurities and contaminants from the diesel fuel, which can cause wear or damage to the fuel injection system. They are typically installed:

- Primary Filter: Located close to the tank, removing larger particles.
- Secondary (or Fine) Filter: Positioned before the high-pressure pump for finer filtration.

Fuel Lines and Hoses

These convey fuel through the system, connecting the tank to the pump, filter, injection system, and return lines. They are constructed to withstand high pressures and prevent leaks.

Fuel Injection System

The core component responsible for delivering atomized fuel into the engine cylinders. It comprises:

- Injectors: Spray fuel directly into the combustion chambers.
- Injection Pump: Delivers high-pressure fuel in precise quantities and timing.

In modern systems, this is often a common rail system where fuel is stored at high pressure in a shared rail before being injected.
