Answer Key to Specific Questions on Species Interactions

This section addresses common questions through an answer key format to clarify misconceptions and deepen understanding.

Q1: Are mutualism and symbiosis the same?

A: Not exactly. Mutualism is a type of symbiosis, which is any close and long-term biological interaction between two species. Symbiosis includes mutualism, commensalism, and parasitism. Mutualism specifically benefits both species involved.

Q2: Can species switch their type of interaction over time?

A: Yes. Many interactions are context-dependent. For example, a commensal organism may become parasitic if the relationship shifts towards exploiting the host more aggressively. Environmental changes and population dynamics can influence these shifts.

Q3: How do invasive species affect existing species interactions?

A: Invasive species can disrupt existing interactions by outcompeting native species, serving as new predators or parasites, or altering mutualistic relationships. This can lead to declines or extinctions of native species and overall ecosystem imbalance.

Q4: What is the role of keystone species in species interactions?

A: Keystone species have a disproportionately large effect on their community relative to their abundance. They influence many other species, often through predation or mutualism, maintaining community structure and diversity.

Q5: How do species interactions influence evolution?

A: Interactions such as predation, parasitism, and mutualism exert selective pressures that drive co-evolution. For example, prey develop defenses, while predators evolve better hunting strategies.
