Sample Physiology Practice Questions and Answers

Systemic Approach: Cardiovascular System

Q1. What is the primary function of the sinoatrial (SA) node?

A: The primary function of the sinoatrial (SA) node is to generate electrical impulses that initiate the heartbeat, acting as the heart's natural pacemaker.

Q2. Which blood vessels carry oxygen-rich blood away from the heart?

A: The arteries, specifically the aorta and its major branches, carry oxygen-rich blood away from the heart to the tissues.

Q3. Describe the cardiac cycle phases.

A: The cardiac cycle consists of systole (contraction phase) and diastole (relaxation phase). During systole, the ventricles contract to pump blood out, whereas during diastole, the heart chambers relax and fill with blood.

Systemic Approach: Respiratory System

Q4. What is the primary muscle involved in quiet inspiration?

A: The diaphragm is the primary muscle responsible for quiet inspiration, contracting downward to enlarge the thoracic cavity.

Q5. How does oxygen exchange occur in the alveoli?

A: Oxygen diffuses from the alveolar air into the pulmonary capillaries due to a concentration gradient, while carbon dioxide diffuses from the blood into the alveoli to be exhaled.

Q6. What factors influence the rate of respiration?

A: Factors include carbon dioxide levels, oxygen levels, pH of blood, and neural inputs from respiratory centers in the brainstem.

Systemic Approach: Nervous System

Q7. What is the function of the myelin sheath in neurons?

A: The myelin sheath insulates the axon, increasing the speed of electrical impulse conduction along the neuron.

Q8. Which part of the brain is primarily responsible for coordinating balance and coordination?

A: The cerebellum is primarily responsible for coordinating balance, movement, and coordination.

Q9. Differentiate between the sympathetic and parasympathetic nervous systems.

A: The sympathetic nervous system prepares the body for 'fight or flight' responses, increasing heart rate and energy expenditure. The parasympathetic nervous system promotes 'rest and digest' functions, decreasing heart rate and conserving energy.

Systemic Approach: Endocrine System

Q10. Which gland produces insulin?

A: The pancreas produces insulin.

Q11. What is the primary function of thyroid hormones?

A: Thyroid hormones regulate metabolism, growth, and development.

Q12. How do negative feedback mechanisms regulate hormone levels?

A: Negative feedback loops maintain hormone homeostasis by reducing hormone secretion once the desired effect or hormone levels are achieved.

Application-Based Questions

Q13. A patient presents with symptoms of tachycardia, hypertension, and anxiety. Which part of the nervous system is likely overactive?

A: The sympathetic nervous system is likely overactive.

Q14. During intense exercise, which physiological adjustments help meet increased oxygen demands?

A: Increased heart rate, increased respiratory rate, vasodilation of muscles, and enhanced oxygen extraction by tissues.

Q15. Explain how the kidneys contribute to blood pressure regulation.

A: The kidneys regulate blood pressure by controlling blood volume through urine excretion and secreting renin, which activates the renin-angiotensin-aldosterone system, leading to vasoconstriction and fluid retention.

Advanced Practice Questions

Systemic Approach: Digestive System

Q16. What enzymes are responsible for carbohydrate digestion in the small intestine?

A: Amylase from saliva and pancreatic amylase continue carbohydrate digestion, breaking polysaccharides into simple sugars.

Q17. How does the stomach protect itself from its own acidic environment?

A: The stomach secretes mucus and bicarbonate to neutralize acid and protect the mucosal lining from erosion.

Systemic Approach: Musculoskeletal System

Q18. What is the role of calcium in muscle contraction?

A: Calcium binds to troponin on the actin filaments, causing a conformational change that allows myosin to bind to actin and initiate contraction.

Q19. Describe the difference between isotonic and isometric muscle contractions.

A: Isotonic contractions involve muscle shortening or lengthening while producing movement, whereas isometric contractions generate force without changing muscle length.

Question What is the primary function of the sodium-potassium pump in cell physiology? The sodium-potassium pump maintains cellular electrochemical gradients by actively transporting 3 sodium ions out of the cell and 2 potassium ions into the cell, which is essential for nerve impulse transmission and muscle contraction. **Answer** How does the respiratory system regulate blood pH? The respiratory system regulates blood pH by controlling the levels of carbon dioxide; increased ventilation reduces CO₂, decreasing acidity, while decreased ventilation retains CO₂, increasing acidity, thus helping maintain acid-base balance. What role does the hormone aldosterone play in kidney physiology? Aldosterone promotes sodium reabsorption and potassium excretion in the distal tubules of the kidneys, helping to regulate blood pressure and electrolyte balance. Which part of the brain is primarily responsible for regulating autonomic functions such as heart rate and digestion? The hypothalamus is primarily responsible for regulating autonomic functions, including heart rate, blood pressure, and digestion. What is the significance of the length-tension relationship in skeletal muscle physiology? The length-tension relationship describes how the force a muscle can generate depends on its length at the time of contraction; optimal overlap of actin and myosin filaments produces maximum tension. How do the parasympathetic and sympathetic nervous systems differ in their effects on the heart? The parasympathetic nervous system decreases heart rate by releasing acetylcholine, whereas the sympathetic nervous system increases heart rate and contractility through the release of norepinephrine. What is the function of the myelin sheath in nerve conduction? The myelin sheath insulates nerve fibers, increasing the speed of electrical impulses

along the nerve by facilitating saltatory conduction. How does the body respond to hypoglycemia in terms of hormonal regulation? In response to hypoglycemia, the pancreas decreases insulin secretion and increases glucagon secretion, promoting glycogen breakdown and glucose release into the bloodstream. What is the role of the sarcoplasmic reticulum in muscle contraction? The sarcoplasmic reticulum stores calcium ions and releases them during muscle contraction, enabling actin-myosin cross-bridge formation and muscle shortening. Which physiological mechanism is primarily responsible for maintaining blood pressure during orthostatic (standing) changes? Baroreceptor reflexes in the carotid sinus and aortic arch detect blood pressure changes and activate autonomic responses to constrict blood vessels and increase heart rate, maintaining stable blood pressure during positional changes.
