Question Types and Difficulty Levels

The questions varied in complexity, ranging from straightforward computational problems to more conceptual or multi-step reasoning items. Some common question types included:

- Computing derivatives or integrals of given functions.
- Interpreting graphs of functions, derivatives, or integrals.
- Applying calculus concepts to real-world scenarios.
- Matching functions to their derivatives or antiderivatives.
- Determining the behavior of a function based on its derivative or second derivative.

Key Themes and Topics in the 2012 Multiple Choice Questions

Limits and Continuity

Many questions tested students' understanding of how to evaluate limits, including those involving indeterminate forms, limits at infinity, and limits of composite functions. For example, a typical question might ask students to determine the limit of a rational function as x approaches a specific value or to analyze the continuity of a function at a point.

Derivative Applications

Derivative questions often involved finding slopes of tangent lines, analyzing the increasing or decreasing nature of functions, and identifying points of local maxima or minima. Several questions required students to interpret the derivative graphically or to use derivatives to solve optimization problems.

Integrals and Area Calculations

Questions on integrals often involved calculating definite integrals to find areas under curves or to evaluate accumulated quantities. Some questions tested understanding of the Fundamental Theorem of Calculus, requiring students to connect derivatives and integrals.

Series and Sequences (BC Specific)

Although less prominent in 2012, some BC questions involved analyzing the convergence or divergence of series, or identifying the limit of a sequence. These questions tested advanced understanding of infinite sums and related concepts.

Sample Questions and Their Analysis

Sample Question 1: Limits and Continuity

Question: Evaluate the limit $\lim_{x \rightarrow 2} (x^2 - 4) / (x - 2)$.

Solution: Recognize that directly substituting $x=2$ results in $0/0$, an indeterminate form. Factoring numerator yields $(x - 2)(x + 2)$. Simplifying:

- $(x - 2)(x + 2) / (x - 2) = x + 2$, for $x \neq 2$.
- As x approaches 2, the limit is $2 + 2 = 4$.

This question tests understanding of factoring and limits involving indeterminate forms.

Sample Question 2: Derivative Application

Question: A particle moves along a line with position function $s(t) = t^3 - 6t^2 + 9t$. At what time $t \geq 0$ is the particle at rest?

Solution: Find when the velocity $v(t) = s'(t) = 3t^2 - 12t + 9$ equals zero.

- Set $3t^2 - 12t + 9 = 0$.
- Divide through by 3: $t^2 - 4t + 3 = 0$.
- Factor: $(t - 1)(t - 3) = 0$.
- Solutions: $t = 1$ or $t = 3$.

Since $t \geq 0$, both are valid times when the particle is at rest.

Sample Question 3: Integration and Area

Question: Find the area between the curve $y = x^2$ and the x-axis from $x=0$ to $x=2$.

Solution: Compute the definite integral:

$$\int_0^2 x^2 dx = \left[\frac{x^3}{3} \right]_0^2 = \left(\frac{8}{3} \right) - 0 = \frac{8}{3}.$$

The area under the curve from 0 to 2 is $\frac{8}{3}$.
