Biomechanics and Physiology of Running

A thorough understanding of running biomechanics illuminates why certain techniques and training methods optimize performance and prevent injury.

The Mechanics of a Running Gait

Running involves complex coordination of muscles, joints, and neurological signals. The gait cycle comprises two main phases:

- Stance Phase: Foot contacts the ground, absorbing impact and generating propulsion.
- Swing Phase: The limb moves forward to prepare for the next contact.

Key biomechanical variables include:

- Stride Length: Distance covered per step.
- Cadence: Steps per minute.
- Ground Contact Time: Duration each foot remains in contact with the ground.
- Vertical Oscillation: Up-and-down movement, influencing efficiency.

Muscles and Energy Systems

Major muscles engaged include:

- Quadriceps, hamstrings, glutes, calves, and tibialis anterior.

Running primarily uses aerobic energy systems, with occasional reliance on anaerobic pathways during sprints or steep climbs.

Impact Forces and Injury Prevention

- Impact peaks occur at foot strike, especially in heel-strikers.
- Overuse injuries such as stress fractures, plantar fasciitis, and IT band syndrome are common.
- Proper footwear, running form, and training progression are critical in mitigating risks.
