It plays a crucial role in everyday life, from cooking and weather patterns to industrial processes and energy production. The study of heat involves understanding how energy moves, how it affects matter, and how it can be measured and controlled.

Basic Concepts of Heat

Definition of Heat

Heat is the energy transferred between objects or systems because of temperature difference. It flows from a hotter object to a colder one until thermal equilibrium is reached.

Temperature vs. Heat

- Temperature: A measure of the average kinetic energy of particles within a substance.
- Heat: The energy transferred due to temperature difference.

Units of Heat

- Kilocalorie (kcal): $1 \text{ kcal} = 1000 \text{ cal}$, often used in nutrition.

Modes of Heat Transfer

Heat can be transferred through three main mechanisms:

Conduction

- Transfer of heat through a solid material.
- Occurs via direct molecular collision.

Determine the heat required to melt a certain amount of ice:

Example:

How much energy is needed to melt 50 g of ice at 0°C? (Latent heat of fusion for ice ? 334 J/g)

Solution:

$$Q = m \times L_f = 50 \text{ g} \times 334 \text{ J/g} = 16,700 \text{ J}$$

- Efficiency of Heat Engines

Calculate the efficiency given the hot and cold reservoir temperatures:

Example:

A heat engine operates between 600 K (hot) and 300 K (cold). Find its maximum efficiency.

Solution:

$$\text{Efficiency} = 1 - (T_c / T_h) = 1 - (300 / 600) = 0.5 \text{ or } 50\%$$
