Understanding Elementary Statistics Word Problems

Before diving into specific examples, it's important to understand what elementary statistics word problems involve. These problems typically describe a scenario involving data collection, analysis, or interpretation, and require the student to apply statistical concepts to find a solution.

Common themes in elementary statistics problems include:

- Descriptive statistics (mean, median, mode, range)
- Probability
- Percentages and ratios
- Data interpretation
- Basic inferential statistics

Approaching these problems involves careful reading, identifying what is being asked, extracting relevant data, and choosing the appropriate statistical method.

Types of Elementary Statistics Word Problems and Solutions

Below are several common types of elementary statistics word problems, each accompanied by detailed solutions and tips for solving similar problems.

1. Calculating the Mean (Average)

Problem:

A class of 10 students scored the following marks in a math test: 75, 88, 92, 85, 79, 94, 90, 87, 78, 83. Find the average score.

Solution:

- Step 1: Add all scores.

$$\text{Total} = 75 + 88 + 92 + 85 + 79 + 94 + 90 + 87 + 78 + 83 = 851$$

- Step 2: Divide the total by the number of students.

$$\text{Average} = 851 \div 10 = 85.1$$

Answer: The average score is 85.1.

Tips:

- Sum all data points carefully.
- Divide by the total count to find the mean.

2. Finding the Median

Problem:

Find the median of the test scores: 60, 70, 80, 85, 90, 95, 100.

Solution:

- Step 1: Arrange data in order (already sorted).
- Step 2: Count the total number of data points (7).
- Step 3: Find the middle value.

Since 7 is odd, median is the 4th value: 85.

Answer: The median score is 85.

Tips:

- For odd numbers, the median is the middle number.
- For even numbers, average the two middle numbers.

3. Determining the Mode

Problem:

In a survey of favorite fruits among students, the responses are: Apple, Banana, Apple, Orange, Banana, Apple. Find the mode.

Solution:

- Count the frequency of each fruit:
- Apple: 3
- Banana: 2
- Orange: 1
- The most frequent response is Apple.

Answer: The mode is Apple.

Tips:

- The mode is the most frequently occurring data point.
- There can be more than one mode if multiple data points share the highest frequency.

4. Calculating Range

Problem:

Find the range of the following test scores: 65, 70, 75, 80, 85.

Solution:

- Identify the highest and lowest scores:

Highest = 85

Lowest = 65

- Subtract to find range:

Range = $85 - 65 = 20$

Answer: The range is 20.

Tips:

- Range provides an idea of data spread.
- Always subtract the smallest value from the largest.

5. Probability of an Event

Problem:

A bag contains 5 red balls and 3 blue balls. If a ball is randomly selected, what is the probability it is blue?

Solution:

- Total balls = $5 + 3 = 8$
- Favorable outcomes (blue balls) = 3
- Probability = Number of favorable outcomes $\div$ total outcomes = $3 \div 8$

Answer: The probability of selecting a blue ball is $3/8$.

Tips:

- Express probability as a fraction, decimal, or percentage.
- Simplify fractions where possible.

6. Percentages in Data

Problem:

In a class of 40 students, 10 students prefer basketball. What percentage of students prefer basketball?

Solution:

$$\text{- Percentage} = (\text{Number of students who prefer basketball} \div \text{Total students}) \times 100$$

$$= (10 \div 40) \times 100 = 0.25 \times 100 = 25\%$$

Answer: 25% of students prefer basketball.

Tips:

- Convert the fraction to a decimal before multiplying by 100 for percentage.

- Percentage = $(15 \div 50) \times 100 = 0.3 \times 100 = 30\%$

Answer: 30% of students like tennis.

Practice Problem 2:

The ages of five children are 4, 6, 8, 10, and 12. Find the mean and median age.

Solution:

- Mean = $(4 + 6 + 8 + 10 + 12) \div 5 = 40 \div 5 = 8$
- Median (middle value in ordered data) = 8

Answer:

- Mean age = 8 years
- Median age = 8 years

Practice Problem 3:
