What is a Laser?

A laser (Light Amplification by Stimulated Emission of Radiation) is a device that emits a narrow, coherent, and monochromatic beam of light through the process of stimulated emission. Unlike conventional light sources, lasers produce highly collimated beams with minimal divergence, making them ideal for precision applications.

Historical Background

The development of the laser dates back to the 1950s, with key milestones including the invention of masers and the first optical laser by Theodore Maiman in 1960. This historical perspective helps students appreciate the technological evolution and the pioneering work that led to today's versatile laser applications.

Principles of Laser Operation
