How the Mercruiser Bravo One Cooling System Works: Step-by-Step

Understanding the flow of coolant and water through the system helps in troubleshooting and

maintenance.

Step 1: Raw Water Intake

- The raw water intake fitting draws water from the water body.
- The water passes through the strainer, which filters out debris and large particles.

Step 2: Raw Water Pump Activation

- The raw water pump impeller spins, creating suction to draw water into the pump.
- The water is then pushed through the system toward the heat exchanger.

Step 3: Heat Exchange Process

- Coolant from the engine circulates through the heat exchanger's internal tubes.
- Raw water flows around these tubes, absorbing heat from the coolant.
- The heated raw water then exits the heat exchanger toward the exhaust system.

Step 4: Engine Cooling Loop

- The coolant circulates through engine passages, absorbing heat generated during operation.
- The thermostat regulates the coolant flow, opening or closing based on engine temperature.

Step 5: Exhaust and Water Discharge

- Hot gases and water are expelled through the exhaust system, cooled by water injection.
- The warm water exits the system at the rear of the drive unit, completing the cycle.

Common Issues in the Mercruiser Bravo One Cooling System

Understanding potential problems can help you maintain your cooling system effectively.

1. Impeller Failure

- Symptoms: Overheating, reduced water flow, or no water flow at all.

- Solution: Regular impeller inspection and replacement every 1-2 years.

2. Blocked or Dirty Strainer

- Symptoms: Reduced raw water intake, overheating.
- Solution: Clean or replace the strainer regularly.

3. Leaking or Corroded Heat Exchanger
